"Computer science graduate (2:1) seeking junior backend/full-stack roles covering the Java, Ruby and Python programming languages. Experience in Spring Boot, REST, CI/CD, automated testing, JPA and Hibernate."

EDUCATION:

BSc Computer Science | University of Sheffield: Graduated with an upper second-class (2:1) **2023-2026**

A-Levels | Thomas Clarkson Academy: Computer Science, Maths, Further Maths (AAB) **2021-2023**

UNIVERSITY PROJECTS:

Web Portal and Dashboard

[Java · Spring Boot · Gradle · Spring Security · MySQL · Bootstrap · Thymeleaf · JPA · Hibernate]

- Collaborated in a full-stack agile team building a small but scalable Java/Spring Boot web application end-to-end, from database schema through to UI.
- Implemented an authentication and authorisation system using Spring Security to prevent unauthorised access to restricted routes.
- Wrote an extensive test suite covering controller unit tests, database integration tests, and end-to-end UI interaction; provided testing training to teammates and reached 97% coverage across 72 independent tests.
- Used MySQL for persistent session storage across multiple users and Bootstrap/Thymeleaf for dynamically generated, accessible content.

Reengineering of the 'HTTPie CLI' Library (https://github.com/PigeonSpy/software-reengineering-httpie)

[Python · PyLint · PyReverse · PyDriller · CI]

- Applied static, dynamic, and repository analysis to surface code smells and guide targeted reengineering effort across a real open-source codebase.
- Set up GitHub Actions tor run HTTPie's existing regression suite on every push so that each refactor was checked automatically for regressions.
- Rationalised the test suite by removing dead code and selecting minimal variable sets for maximum branch coverage retaining full coverage with fewer cases.
- Coordinated team tasks to maintain flow and minimise idle time, keeping the backlog visible to all contributors.

Full-Stack Kanban Web App with External API Integration

[Ruby · Ruby on Rails · RESTful API · JSON]

- Collaborated in a full-stack team to develop a technical solution for an online Kanban board integrating a live external business API, delivered as a company project pitch.
- Translated high-level client requirements into prioritised story cards, running regular sprint reviews to track delivery and present progress to stakeholders.
- Implemented RESTful API communication, handling full JSON request/response lifecycles within the Rails application

3D Hierarchical Scene Rendering using OpenGL

[Java · OpenGL]

- Built a real-time 3D rendering engine in Java using OpenGL, implementing a hierarchical scene graph with optimised rasterization and rendering pipelines.
- Applied viewport culling and Java garbage collection strategies to minimise memory footprint and improve frame performance.
- Managed a strict deadline by decomposing delivery into a minimum viable product first, then iterating in an agile fashion delivering a complete optimised scene graph renderer ahead of deadline.

EXPERIENCE:

Global Engineering Challenge

- Led a six-member multi-disciplinary team developing a solution to a constrained engineering problem, balancing economic and social factors.
- Ran structured meetings, distributed workload equitably, and set iterative targets while applying agile principles in a cross-functional team context. Contributing to risk assessment and project planning.

GCSE Maths Peer Tutor

- Delivered revision sessions to GCSE students; received positive feedback from both pupils and teaching staff, demonstrating clear communication and patience.

HOBBIES:

Music Production – production of music for both an ongoing game development project and general music

Game Development – developing a village simulator with dynamic resources, NPCs, custom sprites and music with online (singleplayer) play in a popular game engine.
